In modern protocol design, protocols are layered to form a protocol stack. Layering is a design principle which divides the protocol design task into smaller steps, each of which accomplishes a specific part, interacting with the other parts of the protocol only in a small number of well-defined ways.

The Internet Protocol (IP) is the principal communications protocol in the Internet protocol suite for relaying datagrams across network boundaries. Its routing function enables internetworking, and essentially establishes the Internet.. IP has the task of delivering packets from the source host to the destination host solely based on the IP addresses in the packet headers.
